MLOPS Assignment-2

Tracking a Pre-trained Sentiment Model with MLflow

Name: Bhagyashree Hokrani

USN:4GW23CI005

1. Which run had the lowest latency, and why might that be?

In the first execution, run_batch4 had the lowest latency of 0.034 seconds, followed by run_batch8 (0.047 seconds) and run_batch1 (0.163 seconds).

Processing multiple sentences together reduces repeated inference-call overhead. The exact timings may vary between executions due to model warm-up and system conditions.

2. Did accuracy change between runs? Why or why not?

No. Accuracy remained 1.0 (100%) for all three batch sizes.

The same pretrained sentiment-analysis model and test sentences were used in all runs. Changing the batch size only affects how inputs are grouped for inference; it does not change the model weights or expected predictions.

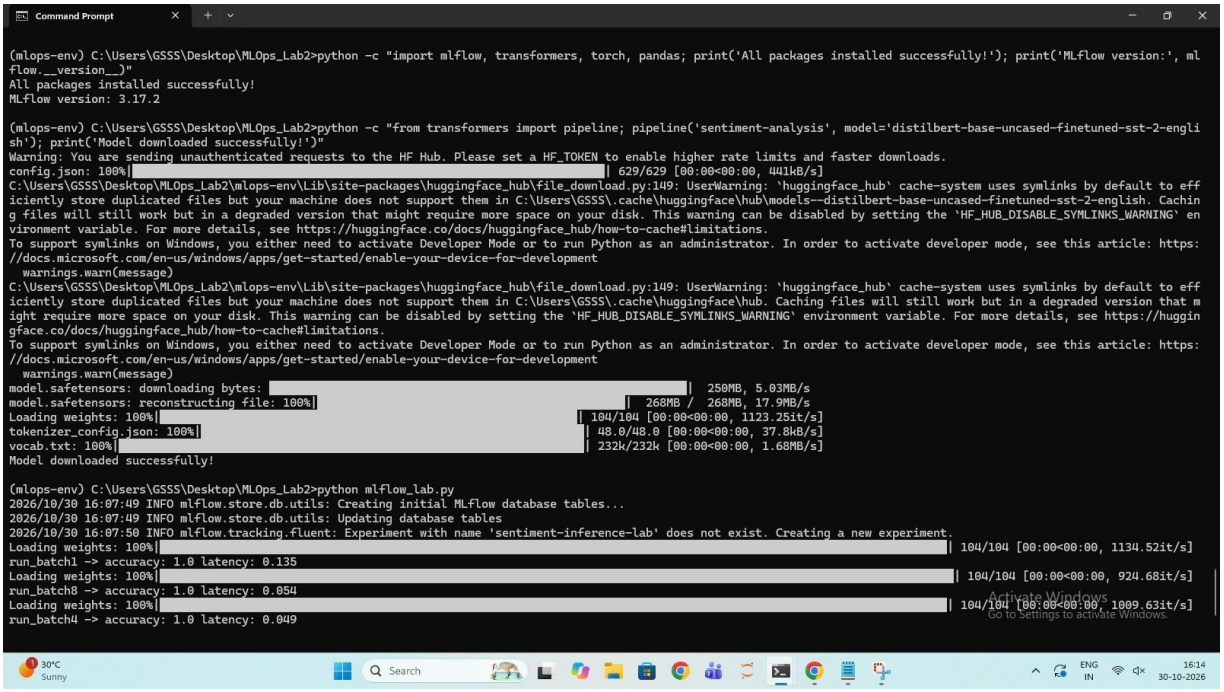

3. Name two benefits of using MLflow here instead of printing results in the terminal.

1. Reproducibility and Record-Keeping:
MLflow saves parameters, metrics, and artifacts such as predictions.csv for future reference and inspection.

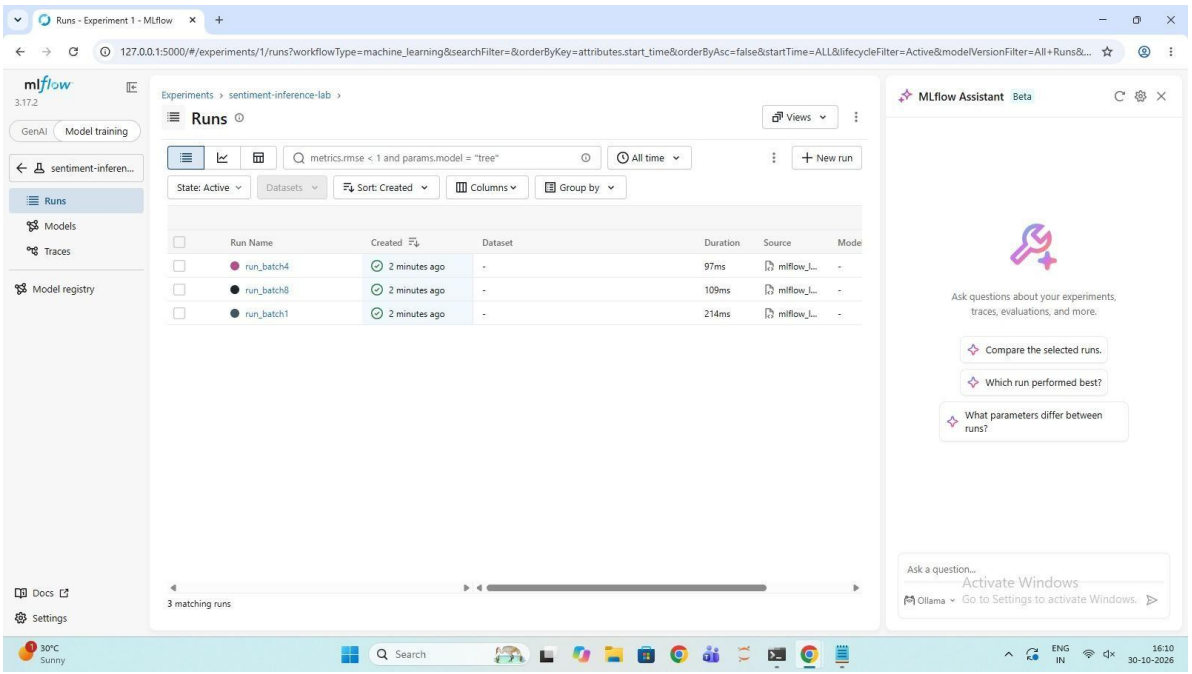

2. Easy Comparison:
MLflow displays multiple runs and their metrics side by side, making it easier to compare accuracy, confidence, and latency than reading terminal output alone**.**

TOOLS AND TECHNOLOGIES USED:

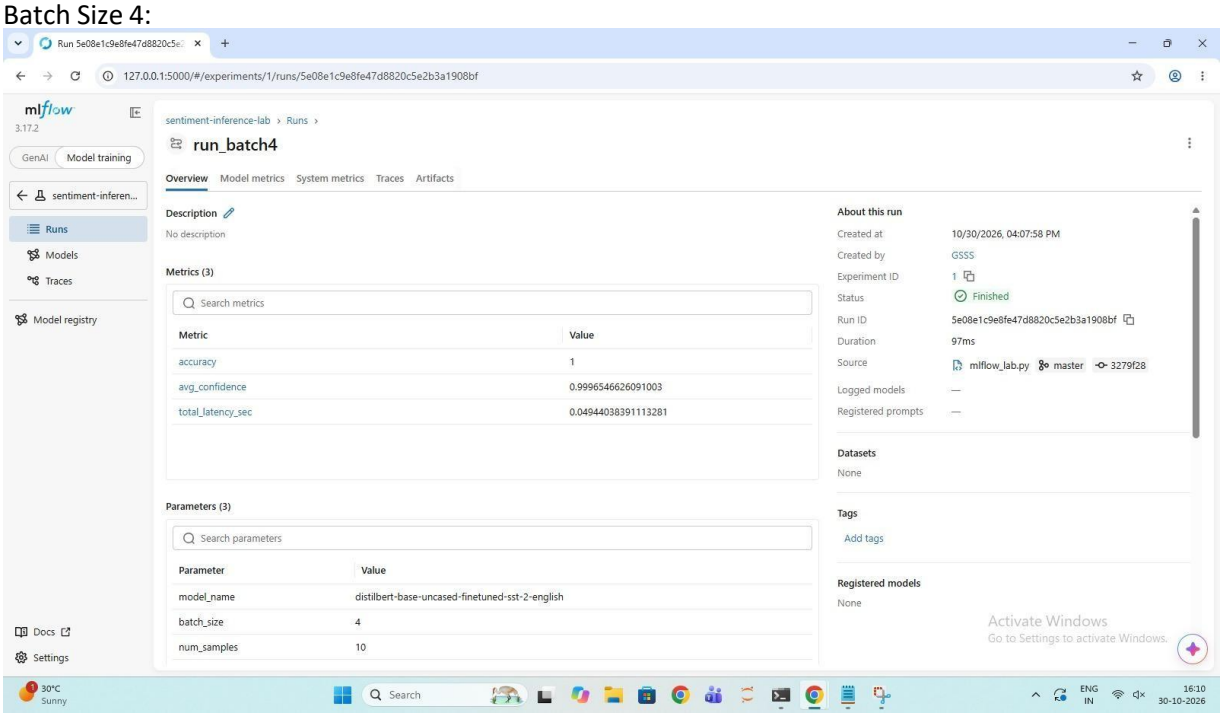

- Windows 11
- Python 3.12
- Visual Studio Code
- MLflow 3.17.2
- Pandas
- DistilBERT Pre-trained Model
- Python Virtual Environment (venv)
- Command Prompt (CMD)
- MLflow Web UI (localhost:5000)

Command Prompt
(mlops-env) C:\Users\GSSS\Desktop\MLOps_Lab2>python -c "import mlflow, transformers, torch, pandas; print('All packages installed successfully!'); print('MLflow version:', mlflow.__version__)"
All packages installed successfully!
MLflow version: 3.17.2
(mlops-env) C:\Users\GSSS\Desktop\MLOps_Lab2>python -c "from transformers import pipeline; pipeline('sentiment-analysis', model='distilbert-base-uncased-finetuned-sst-2-english'); print('Model downloaded successfully!')"
